

Background

In AIESEC we have two products where we focus on professional internships abroad. Recently we have identified that we can sell these two products via LinkedIn job opportunities portal. Currently we are having 7 local entities in Sri Lanka and we are expecting to have a system to get all these LinkedIn sign ups via 7 signup forms.

Requirements

- Creating 7 signup forms where it directs the signups to the respective local entity.
- Creating an admin dashboard where the authentication should be distributed as follows,
 - AIESEC Sri Lanka - Admin access to all the data coming from all the 7 signup forms.
 - Local entity 1 - Only the signups are coming from their own signup form
Likewise all the 7 entities have to function in the same way.
- Admin dashboard
 - Separate authentications for all the stakeholders using their login credentials
 - One system to the admin where they can get all the data
 - Sort the data based on the newest arrival
- Followings are the details of the 8 entities,
 - CC
 - CN
 - CS
 - USJ
 - Kandy
 - Ruhuna
 - SLIIT
 - MC (admin) - Admin should be aware from which signup form directing the signups. (Example - If a signup coming from CC then under the field entity it has to showcase CC)
- Sample - <https://www.aiesec.lk/intern-abroad-cc/>
